Functional magnetic resonance imaging or functional MRI (fMRI) measures brain activity by detecting changes associated with blood flow. This technique relies on the fact that cerebral blood flow and neuronal activation are coupled. When an area of the brain is in use, blood flow to that region also increases.

Functional MRI is a brain imaging technique that detects the blood flow within the brain, allowing researchers to see which parts of the brain are active while a person is doing various tasks. It can also be used to understand what brain regions' activities are in sync with each other; that is, "connected."

Introduction. In the last two decades, magnetic resonance imaging (MRI) techniques such as functional magnetic resonance imaging (fMRI) , and diffusion weighted imaging for neuronal fiber tractography , , have revolutionized our ability to investigate the human brain. These techniques mostly rely on echo planar imaging (EPI) for spatial encoding of the magnetic resonance image because of its ...

Among different and currently-available imaging techniques for the study of the olfactory system, functional magnetic resonance imaging (fMRI) has been more encouraging and is able to detect areas of brain activity in response to odorant stimulation in more detail than older methods[3.11.12]. However, its use is still limited to research centers.

The aim of the study was to see if the use of MR spectroscopic imaging (MRSi) along with functional MRI (fMRI) can better define both the target and the critical structures to be avoided to improve radiation delivery in gliomas. 12 patients with gliomas underwent multivoxel MRS and functional imaging using GE processing software.

Functional imaging could help define borders between the various levels of altered consciousness and detect the presence of cryptic residual functions in vegetative or minimally conscious patients. This approach could eventually help determine the neurological outcome and make individual blueprints of the preserved brain activities in severely brain injured patients.
